Andorra Passivated Cable Tray Specifications

Overview

Cable tray is considered to be a system. It must provide continuous support for cables, and the electrical continuity of the cable tray system must be maintained.

Key Takeaways

Andorra passivated cable trays are typically made from AISI 316L stainless steel with a passivated surface, offering high corrosion resistance, mechanical strength, and compliance with IEC 61537 standards.

Material and Surface Treatment

Andorra passivated cable trays are generally fabricated from AISI 316L stainless steel, which contains chromium and molybdenum to enhance corrosion resistance, particularly against chlorides and harsh industrial environments. The passivation process involves treating the stainless steel surface to form a thin, protective oxide layer, improving resistance to rust, pitting, and stress corrosion cracking. This makes them suitable for marine, coastal, chemical, and food-processing installations.

Mechanical Properties

These cable trays are designed to withstand mechanical loads from cables and environmental factors. They are tested for load-bearing capacity, deflection, and structural integrity according to IEC 61537 standards. Typical features include: Rung spacing: 150–230 mm (6–9 inches) for proper cable support and minimal bending stress.

Tray widths: Standard widths range from 150 mm to over 600 mm, depending on application. Connection hardware: Screwed connections (e.g., M6 bolts) ensure secure assembly without damaging cables.

Corrosion and Environmental Resistance

Passivated stainless steel trays are highly resistant to: Oxidizing acids and atmospheric corrosionChloride-induced pittingStress corrosion cracking in industrial environments They are suitable for indoor and outdoor installations, including areas with high humidity, chemical exposure, or salt-laden air.

Compliance and Standards

Andorra passivated cable trays adhere to IEC 61537, which specifies: Mechanical strength testingCorrosion resistance requirementsElectrical continuity for grounding purposes Additionally, they meet CE marking requirements and may comply with other national standards such as NEMA (USA) or EN standards in Europe.

Installation Considerations

Ventilated or solid bottom options are available depending on heat dissipation and cable protection needs. Supports and hangers must maintain proper spacing to prevent sagging and ensure load distribution. Passivated trays should not be exposed to extreme chemical conditions beyond their rated specifications to maintain longevity.

In summary, Andorra passivated cable trays provide durable, corrosion-resistant, and mechanically robust solutions for cable management in demanding environments, with full compliance to international standards for safety and performance.
