Fiber optic patch panel appearance inspection

Overview

Endface inspection focuses on the visible quality of the polished fiber surface and surrounding ferrule area. You use a fiber microscope or automated inspection scope to check for contamination, pits, chips, cracks, and scratches. This checklist covers 36 inspection items across 7 sections: Patch Panel Physical Condition, Patch Cable Routing and Management, Fiber Optic Connector and Ferrule Inspection, Optical Loss and Signal Performance Testing, Fiber Cable Plant Physical Integrity, Labeling, Documentation, and Change. Endface inspection is one of the most critical steps in fiber connector quality control. Even a small dust particle or scratch on the endface can increase insertion loss, reduce return loss, and introduce random link instability.
