

Fiber optic router relocation

Overview

How to move my router to another room Is it possible to relocate my router if I have a fiber optic internet provider?

If you have a fiber optic internet.

Key Takeaways

You can move a fiber optic router by either relocating the optical network terminal (ONT) with your provider's help or running an Ethernet cable from the ONT to a new router location.

Key Considerations

Fiber cables are fragile and have a minimum bend radius, so bending or stretching them can break the glass inside. This makes moving the ONT or fiber line yourself risky. In most cases, the safest approach is to keep the ONT in its original location and run a high-quality Ethernet cable to the new router location.

Steps to Move Your Router

Plan the new location: Choose a central, elevated spot away from walls and obstructions to maximize Wi-Fi coverage. Check cabling options: If your home has Ethernet jacks, you can connect the router to the ONT via the nearest jack. If not, you may need to run a long Ethernet cable from the ONT to the new location.

Use a network switch or access point: If you need multiple wired connections in the new room, connect a switch or configure a secondary router as an access point to expand ports. Power down and disconnect: Turn off the router and unplug all cables before moving. Connect and test: Plug the Ethernet cable into the router at the new location, connect power, and restart the router.

Test Wi-

Fi coverage and speed to ensure optimal performance. Alternatives if Moving the ONT
Call your ISP: Some providers can relocate the ONT to a new room, but this usually requires a technician visit and may incur a fee.

Use Wi-

Fi extenders or mesh systems: If running Ethernet is impractical, a Wi-Fi extender or mesh network can improve coverage without moving the ONT.

Tips for Success

Avoid running Ethernet cables parallel to electrical lines to reduce interference. Measure cable lengths carefully and use high-quality Cat6 or better cables for reliable speeds. If using a secondary router as an access point, disable DHCP to prevent IP conflicts.

By following these steps, you can safely move your fiber optic router to a more convenient location while maintaining strong internet performance.
