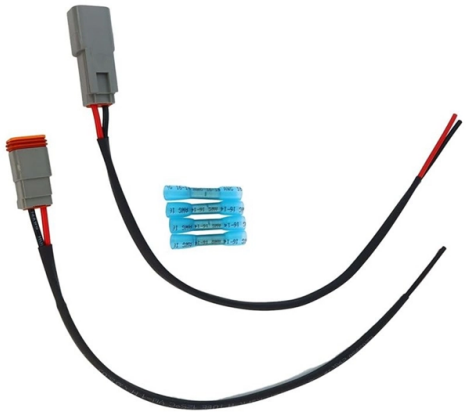
New Zealand Fiber Stripper Smart Installation Solution



Overview

Fiber solutions for New Zealand networks | Hexatronic Fiber SolutionsWe partner with some of the largest telecommunication equipment providers in the world.

Key Takeaways

A complete solution in New Zealand combines certified fiber strippers with professional installation services from experienced providers like atg and Vision Systems, ensuring efficient, high-quality FTTx and industrial network deployment.

Fiber Stripping Tools

For precise and reliable fiber preparation, tools like the CFS-3 three-port fiber optic stripper are widely used. This tool allows technicians to strip fiber jackets and buffer coatings down to the glass fiber with high accuracy. Its three-port design handles different layers: the outer jacket (2–3 mm), buffer coating (600–900 microns), and the 250-micron fiber coating.

Adjustable jaws and included hex keys ensure clean, smooth strips for both residential and industrial networks, including FTTB systems. Other options, such as Jonard Tools' JIC-1022 and CST-4000, provide versatile stripping for various cable sizes and reduce hand fatigue during repetitive tasks.

Professional Installation Services

In New Zealand, companies like atg and Vision Systems offer end-to-end fiber installation solutions. They provide: Network design and planning for residential, hospitality, and multi-dwelling environments. Certified installation teams capable of deploying structured cabling systems and FTTx networks efficiently.

Testing and maintenance support, ensuring networks perform reliably from day one. Training and technical support for proper use of fiber tools and equipment. These providers integrate smart installation practices, combining high-quality tools with professional expertise to optimize network speed, reliability, and scalability.

Smart Installation Considerations

A smart installation solution in New Zealand should include: Certified fiber strippers for accurate and safe cable preparation. Structured cabling design tailored to the building or site requirements. Professional installation and testing to ensure minimal signal loss and long-term reliability.

Integration with high-speed broadband networks, such as GPON, supporting speeds up to 900+ Mbps. By combining these elements, businesses and residential projects can achieve efficient, future-proof fiber networks with minimal downtime and high performance.

Conclusion

For a smart fiber installation solution in New Zealand, the recommended approach is to use precision fiber strippers like the CFS-3 or Jonard tools, paired with certified installation services from providers such as atg or Vision Systems. This ensures clean fiber preparation, professional deployment, and reliable network performance for both residential and industrial applications.
