

Price of non-Dutch coated surface

Overview

Coating Calculator — Complete Guide to All Coating and Surface Tools
Coating Calculator offers easy-to-use tools for accurate coating and surface preparatio.

Key Takeaways

The cost of a non-Dutch coated surface typically ranges from \$3 to \$10 per square foot, depending on the coating type, surface preparation, and installation method.

Material Costs

The price varies significantly based on the type of coating chosen: Epoxy coatings: \$3-\$7 per square foot for materials alone, known for durability and chemical resistance. Polyurethane coatings: Slightly higher, offering excellent UV resistance and flexibility, ideal for outdoor applications. Acrylic coatings: More budget-friendly, generally used for lighter-duty surfaces, costing less than epoxy or polyurethane.

Additional Factors

Surface preparation: Cleaning, grinding, or priming can add \$0.50-\$1 per square foot. Protective sealants: Optional topcoats may increase costs slightly.

Labor: Professional installation can add \$5-\$10 per square foot, depending on complexity and local rates.

Estimating Total Cost

To calculate the total expense: Measure the surface area. Choose the coating type and determine material cost. Add surface prep and optional sealant costs.

Include labor if hiring professionals. For example, coating a 100-square-foot area with epoxy, including prep and professional installation, could cost approximately \$800–\$1,700.

Market Trends

For industrial coatings, raw material prices fluctuate based on supply and demand. Tools like the European Coatings Price Ticker provide up-to-date pricing for resins, pigments, and other components, helping buyers negotiate effectively. By considering these factors, you can estimate the cost of a non-Dutch coated surface accurately and plan your project budget accordingly.
