Replacing optical modules in communication equipment

Overview

Follow these guidelines when replacing an optical module: Wear an ESD wrist strap or gloves when replacing the cables. Ensure that the new optical module has the same center wavelength and complies with the same standards as the old one. The device must use optical modules recommended on the configurator because non-Huawei-certified optical modules cannot ensure transmission reliability. Take ESD protection measures when replacing optical modules. It uses optical fibers to transmit signals, offering significant improvements in transmission speed and quality over traditional electrical signal. SFP and other optical modules are key components of any fibre optic network. They enable high-speed connections between active equipment and allow system scalability without the need for full infrastructure replacement. It's essential to understand how to properly install and configure an SFP. Small Form-factor Pluggable modules (SFP module) are the workhorses of modern network connectivity, enabling flexible fiber optic or copper links between switches, routers, firewalls, and servers.
