

What does PC Polypropylene mean in fiber optic pigtails

Overview

A PC fiber pigtail made with physical contact polished connector. Fiber patch cords and pigtails are the "last meter" components that connect active equipment (switches, routers, OLTs, ONTs) to the fiber infrastructure. Despite representing less than 1% of total fiber infrastructure cost, they account for 30-40% of all fiber network faults in enterprise and data. A fiber optic pigtail is a short length of optical fiber—typically 0.5m to 2m—that has a factory-terminated connector on one end and bare fiber on the other end. The bare fiber end. PC (Physical Contact) refers to a connector type manufactured through micro-spherical polishing: The ferrule surface is precision-ground into a slight spherical curvature, with the fiber core positioned precisely at the apex of the curvature. Ultra-light, ultra-thin, ultra-fragile. 657 bend-insensitive for FTTH & tight spaces.
