Which is better fiber optic patch cords or copper wires

Overview

This guide compares copper vs fiber, highlighting their strengths and limitations across transmission distance, power delivery, device density, and practical deployment scenarios. Understanding these factors can help make informed decisions, ensuring efficient and reliable. The two core material technologies used in almost all cables are fiber optic, and copper wiring. Whether you're looking at an HDMI cable, a USB cable, Ethernet patch cable, or any other kind of network of data transmission cabling, they are all built using copper or fiber optic internal wiring. Fiber optic cables and copper wires are the two primary types of cables used in networks. Copper cables are limited to around 100 meters, whereas certain single-mode fiber optic cables can efficiently transmit data over distances of up to 25 miles.
