# Wired fiber optic cable upgrade

## Overview

Get fiber internet installation done right for your home or business. Enjoy lightning-fast speeds and stable connections with professional setup.

## Key Takeaways

Upgrading to a wired fiber optic network can dramatically increase speed, bandwidth, and reliability, often without needing a full home rewiring. Do You Need to Rewire? For most homes, rewiring is not required for the fiber line itself.

Fiber optic service typically terminates at an Optical Network Terminal (ONT), which converts the optical signal into an electrical signal.

### From the ON

T, standard Ethernet cables (Cat 5e, Cat 6, or Cat 6a) connect to your router. If your router is near the ONT and you primarily use Wi-Fi, your existing internal wiring is usually sufficient. However, to fully utilize gigabit or multi-gigabit speeds for wired devices, upgrading internal Ethernet cabling may be necessary, especially in older homes with only telephone wiring or outdated Cat 5 cables.

### Benefits of Fiber Over Copper

Fiber optic cabling offers several advantages over traditional copper Ethernet: Higher bandwidth: Fiber can handle significantly more data, supporting speeds from 1 Gbps up to 100 Gbps and beyond. Faster transmission: Data travels as light signals, reducing latency and signal degradation over long distances. Long-distance capability: Fiber supports runs far beyond copper's 300-foot limitation, making it ideal for large homes or enterprise networks.

Future-proofing: Fiber networks can be upgraded to multi-gigabit speeds through electronics upgrades without replacing the cables themselves.

### Installation Options

Professional Installation: Your ISP can install fiber to your home, including the ONT and any necessary internal connections. This ensures optimal performance and compliance with local building codes.

DI

Y Fiber Kits: Products like the InvisiLight Home Fiber Kit allow you to run fiber directly to devices using media converters, providing point-to-point high-speed connections without major construction. These kits are nearly invisible, easy to install, and maintain full gigabit speeds for gaming, streaming, and video conferencing.

### Choosing the Right Fiber

Multimode fiber: Best for short distances (up to a few hundred meters), suitable for home or office LANs. Single-mode fiber: Ideal for long-distance backbone connections (up to 80–100 km with proper transceivers), often used in enterprise or campus networks. Hybrid approach: For retrofits, combining fiber for the backbone and copper for access points can improve performance without a full overhaul.

### Key Considerations

Assess your current internal wiring and device locations to determine if Ethernet upgrades are needed. Consider future bandwidth needs; fiber is scalable and supports next-generation applications. Evaluate installation complexity and cost: professional installation ensures reliability, while DIY kits offer flexibility and minimal disruption.

Upgrading to a wired fiber optic network provides ultra-fast, low-latency, and reliable connectivity, making it ideal for streaming, gaming, remote work, and future-proofing your home or business network.
